0521022614 - Macroscopic Quantum Tunneling of the Magnetic Moment

Eugene M. Chudnovsky and Javier Tejada

Frontmatter

[More information](#)

This is the first book to present a coherent theoretical and experimental treatment of the rapidly developing field of macroscopic quantum tunneling of the magnetic moment.

The theory is based on the concept of the magnetic instanton and its renormalization by the dissipative environment, and the book includes discussions of the tunneling of magnetic moments in small ferromagnetic grains, tunneling of the Néel vector in antiferromagnetic grains, quantum nucleation of magnetic domains, and quantum depinning of domain walls. The experimental part collects the majority of recent data that are, or may be, relevant to spin tunneling. Among the topics described are low-temperature magnetic relaxation and its interpretation in various systems, experiments on single particles and mesoscopic wires, and resonant spin tunneling in molecular magnets.

This study of an important new field in condensed matter physics by two leading contributors to the subject will be of interest to theorists and experimentalists working in magnetism, and will provide a sufficient background to allow either to begin independent research.

Contents

	Preface	<i>xi</i>
Chapter 1	Introduction	<i>1</i>
Chapter 2	Tunneling on a macroscopic scale	8
2.1	A general expression for the tunneling rate	8
2.2	The path integral	11
2.3	Instantons	13
2.4	Finite-temperature effects	17
2.5	Tunneling with dissipation	22
2.6	Generalization to quantum field theory	25
Chapter 3	Magnetism in imaginary time	29
3.1	An overview of the problem of spin tunneling	29
3.2	Tunneling of the magnetic moment in monodomain ferromagnetic particles	36
3.2.1	<i>Model I</i>	38
3.2.2	<i>Model II</i>	41
3.2.3	<i>Model III</i>	42
3.3	The angular dependence of the tunneling rate (model IV)	43
3.4	Tunneling of the Néel vector in antiferromagnetic particles	51
3.5	Tunneling with dissipation, macroscopic quantum coherence, and decoherence	55

X Contents

Chapter 4	Magnetic tunneling in bulk materials	61
4.1	Quantum nucleation of magnetic domains	61
4.2	Quantum depinning of the domain walls	66
4.2.1	<i>The tunneling exponent in 1 + 1 dimensions</i>	71
4.2.2	<i>The tunneling exponent in 2 + 1 dimensions</i>	73
4.2.3	<i>The crossover temperature</i>	74
4.2.4	<i>The pre-exponential factor</i>	75
4.2.5	<i>Additional thoughts on quantum depinning of domain walls</i>	76
4.3	Tunneling of antiferromagnetic domain walls	78
4.4	The effect of dissipation on tunneling of domain walls	79
4.5	Tunneling of flux lines in superconductors	80
Chapter 5	Quantum magnetic relaxation	84
5.1	The physics of slow relaxation in solids	84
5.2	Models of slow relaxation	87
5.2.1	<i>The critical state</i>	87
5.2.2	<i>Ensembles of small particles</i>	89
5.2.3	<i>The zero-field-cooled magnetization curve</i>	92
5.2.4	<i>Computer studies of slow relaxation</i>	94
5.3	Experiments on slow relaxation in small particles	98
5.4	Quantum relaxation in thin films	112
5.5	Quantum relaxation in bulk magnets	115
5.6	Relaxation experiments in superconductors	120
5.7	Additional remarks on relaxation experiments	122
Chapter 6	Other experimental approaches	127
6.1	AC susceptibility and noise measurements	127
6.2	Resonance experiments	132
6.3	The motion of domain walls in mesoscopic wires	138
6.4	Experiments on single particles	141
Chapter 7	Tunneling in magnetic molecules	146
7.1	The Mn-12 acetate complex	146
7.2	Quantum magnetic hysteresis	152
7.3	Magnetic relaxation and AC susceptibility	156
7.4	The theory of thermally assisted spin tunneling in Mn ₁₂ Ac	161
References		167
Index		171

Preface

The book consists of two parts. The first part (Chapters 2–4) is purely theoretical; the second part (Chapters 5–7) is mostly experimental. Chapter 2 contains the general theory of instantons and tunneling with dissipation, which is necessary for understanding the rest of the book. Chapters 3 and 4 deal with magnetic tunneling in single-domain particles and bulk materials, respectively. In Chapter 5, the consequences of tunneling for magnetic relaxation are derived and applied to experiments. Non-relaxation experiments are discussed in Chapter 6. Data on resonant spin tunneling in Mn_{12}Ac , and their interpretation, are presented in Chapter 7. In selecting material for this book we were guided by the principle that the theory must be relevant to experiment while experiments must be relevant to magnetic tunneling. Time may prove that some are not. Lengthy theoretical formulas which are difficult to compare with experiments and experimental data the analysis of which is too complicated have been left out. No doubt, there are important results that did not enter the book because we failed to appreciate their significance. Our list of references serves the single purpose of referring the reader to the original papers that we know and understand; in no way does it constitute a complete list of important works on magnetic tunneling.

The work on this book would have been difficult or impossible without support from the National Science Foundation of the USA, the Spanish and Catalan governments, and the Banco Bilbao Vizcaya. We are also infinitely grateful to Joan Manel Hernandez for linking together a vast number of computer files during the final stage of the work on the book.
