This authoritative volume shows how modern dynamical systems theory can help us in understanding the evolution of cosmological models. It also compares this approach with Hamiltonian methods and numerical studies. A major part of the book deals with the spatially homogeneous (Bianchi) models and their isotropic subclass, the Friedmann–Lemaître models, but certain classes of inhomogeneous models (for example ‘silent universes’) are also examined. The analysis leads to an understanding of how special (high symmetry) models determine the evolution of more general families of models; and how these families relate to real cosmological observations.

This is the first book to relate modern dynamical systems theory to both cosmological models and cosmological observations. It provides an invaluable reference for graduate students and researchers in relativity, cosmology and dynamical systems theory.

Contents

<i>List of contributors</i>	<i>page</i> xi
<i>Preface</i>	xiii
Introduction	1
Part one: Background	9
1 Geometry of cosmological models	
<i>G.F.R. Ellis, S.T.C. Siklos and J. Wainwright</i>	11
1.1 Cosmological models	11
1.2 Symmetries of space–time	20
1.3 Evolution and constraint equations	27
1.4 Orthonormal frame formalism	31
1.5 Bianchi cosmologies	35
1.6 G_2 cosmologies	42
2 Friedmann–Lemaître universes	
<i>G.F.R. Ellis and J. Wainwright</i>	51
2.1 Basic properties and special solutions	51
2.2 Observational parameters	55
2.3 Qualitative analysis	58
2.4 Universes close to Friedmann–Lemaître	62
3 Cosmological observations	
<i>G.F.R. Ellis and J. Wainwright</i>	65
3.1 Observations of discrete sources	65
3.2 The cosmic microwave background radiation	67
3.3 Big–bang nucleosynthesis (BBN)	73
3.4 Is the universe close to FL?	77
3.5 The best–fit FL parameters and the age problem	78

viii	<i>Contents</i>	
4	Introduction to dynamical systems	
	<i>R. Tavakol</i>	84
	4.1 Differential equations and flows	84
	4.2 Orbits and invariant sets	90
	4.3 Behaviour near equilibrium points	94
	4.4 Asymptotic evolution and intermediate evolution	98
	Part two: Spatially homogeneous cosmologies	105
5	Qualitative analysis of Bianchi cosmologies	
	<i>G.F.R. Ellis, C. Uggla and J. Wainwright</i>	107
	5.1 Overview	107
	5.2 Expansion-normalized variables	110
	5.3 Cosmological dynamical systems	115
6	Bianchi cosmologies: non-tilted class A models	
	<i>J. Wainwright</i>	123
	6.1 Evolution equations and state space	123
	6.2 Stability of the equilibrium points	129
	6.3 Asymptotically self-similar models	135
	6.4 The Kasner map and the Mixmaster attractor	143
	6.5 Summary	147
7	Bianchi cosmologies: non-tilted class B models	
	<i>C.G. Hewitt and J. Wainwright</i>	153
	7.1 The evolution equation and state space	153
	7.2 Stability of the equilibrium points	159
	7.3 Asymptotic and intermediate evolution	164
	7.4 Summary	166
8	Bianchi cosmologies: extending the scope	
	<i>C.G. Hewitt, C. Uggla and J. Wainwright</i>	170
	8.1 The exceptional Bianchi $VI_{-1/9}^*$ models	170
	8.2 Bianchi models with a two-fluid source	171
	8.3 Cosmic ‘no-hair’ theorems for Bianchi models	172
	8.4 Tilted Bianchi models	175
	8.5 Recollapsing models	177
	8.6 Other source terms: limitations	183
9	Exact Bianchi cosmologies and state space	
	<i>C.G. Hewitt, S.T.C. Siklos, C. Uggla and J. Wainwright</i>	186
	9.1 Self-similar perfect fluid and vacuum solutions	186
	9.2 Evolving vacuum solutions	195
	9.3 Evolving non-tilted perfect fluid solutions	199
	9.4 The space of initial data	209

<i>Contents</i>		ix
10	Hamiltonian cosmology	
	<i>C. Uggla</i>	212
10.1	The Hamiltonian formulation of Einstein's equations	212
10.2	Relationship with the orthonormal frame approach	217
10.3	Qualitative Hamiltonian cosmology	222
11	Deterministic chaos and Bianchi cosmologies	
	<i>D.W. Hobill</i>	229
11.1	Chaotic dynamical systems	230
11.2	The metric approach	233
11.3	Hamiltonian method	237
11.4	Expansion-normalized variables	237
11.5	Summary	242
	Part three: Inhomogeneous cosmologies	247
12	G_2 cosmologies	
	<i>C.G. Hewitt and J. Wainwright</i>	249
12.1	Evolution equations	250
12.2	Equilibrium points: self-similar models	254
12.3	Evolving models: the separable class	259
12.4	G_2 cosmologies and their specializations	267
12.5	Summary	269
13	Silent universes	
	<i>M. Bruni, S. Matarrese and O. Pantano</i>	271
13.1	Basic equations for silent universes	272
13.2	Dynamical systems analysis	277
13.3	Physical implications	281
13.4	Summary	285
14	Cosmological density perturbations	
	<i>P.K.S. Dunsby</i>	287
14.1	The geometrical approach to density perturbations	288
14.2	Perturbations of FL universes	291
14.3	Perturbations of Bianchi I universes	299
14.4	Summary	303
	Part four: Conclusion	305
15	Overview	
	<i>G.F.R. Ellis and J. Wainwright</i>	307
15.1	Cosmological dynamical systems	308
15.2	Bianchi universes and observations	312
15.3	Inhomogeneous cosmologies	317
	<i>References</i>	319
	<i>Subject index</i>	340

Preface

This book had its origins in a workshop held in Cape Town from June 27 to 2 July 1994, with participants from South Africa, USA, Canada, UK, Sweden, Germany, and India. The meeting considered in depth recent progress in analyzing the evolution and structure of cosmological models from a dynamical systems viewpoint, and the relation of this work to various other approaches (particularly Hamiltonian methods). This book is however not a conference report. It was written by some of the conference participants, based on what they presented at the workshop but altered and extended after reflection on what was learned there, and then extensively edited so as to form a coherent whole. This process has been very useful: a considerable increase in understanding has resulted, particularly through the emphasis on relating the results of the qualitative analysis to possible observational tests. Apart from describing the development of the subject and what is presently known, the book serves to delineate many areas where the answers are still unknown. The intended readers are graduate students or research workers from either discipline (cosmological modeling or dynamical systems theory) who wish to engage in research in the area, tackling some of these unsolved problems.

The role of the two editors has been somewhat different. One (GFRE) has played a standard editorial role in terms of reviewing and editing material; he also initiated and organized the meeting, which took place in South Africa shortly after the transition to democracy there through the remarkable elections of 1994. The meeting was a suitable scientific celebration of those events. The other editor (JW) has been responsible for the main burden of shaping the volume, giving it its overall coherence. We thank the authors for their cooperation in this process, and for reading and commenting on other chapters, which has resulted in a far more useful volume than if it had been just a record of the workshop proceedings. We also thank Richard Matzner,

one of the participants in the workshop, for his contributions concerning cosmological observations, which were very useful to us in writing Chapter 3. We would like to thank Alan Coley, Malcolm MacCallum and David Siegel for their comments on some of the chapters; Henk van Elst for discussions concerning evolution and constraint equations, and for detailed comments on the manuscript; and research students Robert Bridson and Derek Harnett at the University of Waterloo for reading parts of the manuscript and checking calculations. We are particularly indebted to Conrad Hewitt and Claes Uggla for continuing discussions over the past eighteen months.

We thank the Foundation for Research and Development (South Africa) and the Research Committee of the University of Cape Town for financial support of the meeting; our secretary Di Loureiro for her unfailing good humour, efficiency, and helpfulness in its organization; and graduate students Bruce Bassett, Tim Gebbie, Nico Christodoulides, and particularly Conrad Mellin, for the assistance they gave to conference participants. One of us (J. Wainwright) would like to thank the Department of Mathematics and Applied Mathematics at the University of Cape Town and the School of Mathematical Sciences at Queen Mary and Westfield College for their hospitality during several visits while the book was being edited.

As regards the preparation of the manuscript we thank Ann Puncher and Helen Warren at the University of Waterloo for their excellent and efficient work, and unfailing good humour when faced with successive rounds of changes. We also thank Lorraine Kritzer for help with the figures.
