

Contents

1	Maxwell and Schrödinger	1
1.1	Light and Linear Operators	1
1.2	De Broglie's Idea and Schrödinger's Equation	5
1.3	Potentials and Gauge Invariance	9
1.4	Stationary Potentials, Zeeman Shifts	13
1.5	Bound States	16
1.6	Spinless Hydrogenlike Atoms	19
1.7	Landau Levels and Harmonic Oscillator	25
1.8	Orthogonality and Measurements	29
1.9	Operator Methods, Matrices	37
1.10	Scattering and Phase Shifts	47
2	Lorentz, Pauli and Dirac	53
2.1	Lorentz Transformations	53
2.2	Spinless Current, Density of States	57
2.3	Pauli's Electron Spin	60
2.4	The Dirac Equation	65
2.5	Addition of Angular Momenta	70
2.6	Hydrogen Atom and Parity Basis	74
2.7	Alternative Solution, Perturbations	80
2.8	The Pauli Equation	87
2.9	The Zeeman Effect	91
2.10	The Dirac Current. Free Electrons	95
3	Quantum Fields and Particles	101
3.1	The Photon Field	101
3.2	C, P and T	106
3.3	Field Operators and Wave Equations	111
3.4	Breit Operators	116
3.5	Two-Electron States and Pauli Principle	119
3.6	Elimination of Components	123
3.7	Energy Projectors, Improved Breitian	128

4	Scattering and Bound States	133
4.1	Born Series and S-Matrix	133
4.2	Two-Body Scattering and Decay	139
4.3	Current Matrix Elements, Form Factors	149
4.4	Particles of Higher Spins	155
4.5	The Equation for Spinless Binaries	158
4.6	The Leptonium Equation	163
4.7	The Interaction in Leptonium	167
4.8	Binary Boosts	173
4.9	The Klein-Dirac Equation	179
4.10	Eight Components from Four	184
5	Hyperfine Shifts, Radiative Corrections	189
5.1	The First-Order Hyperfine Splitting	189
5.2	The Nonrelativistic Hyperfine Operators	194
5.3	Vacuum Polarization, Dispersion Relations	199
5.4	Atomic Radiation	207
5.5	Soft Photons, Lamb Shift	212
5.6	Antiprotonic Atoms and Hydrogen	219
A	Orthonormality and Expectation Values	223
B	Coulomb Green's Functions	229
	Bibliography	231
	Index	235
