

## Acknowledgements

Even though a dissertation is completed by an individual, it takes the support of many people and institutions for that individual to succeed. First of all, I want to thank my supervisor, Prof. Dr. Pascal Gantenbein. He granted me great freedom to pursue my interests as a researcher. He gave me exceptionally valuable and pragmatic advice whenever needed. Additionally, I am most grateful for his inspiring and motivating style – I always left his office feeling that I was working on a topic both important and fun. Thanks also to my co-supervisor, Prof. Dr. Klaus Spremann, for agreeing to support my research project and for continuously reminding me how important it was to ensure that my volume effect is independent of previously discovered stock return determinants.

I also thank Wegelin & Co. for being the welcoming, open-minded, and supportive organization that it is. Specific thanks goes to the following individuals: Dr. Magne Orglund agreed to support this dissertation and initiated my research interest in the chosen topic. Manuel Krieger and Reto Sonderegger helped me throughout this project and always knew the right person to contact within the organization regarding a particular issue. Finally, I am deeply indebted to Fabian Dori and Patrick Gander, who voluntarily spent many hours to support me with technical aspects of this dissertation. Fabian's profound Matlab programming skills helped me to improve the depth and quality of the analyses; Patrick introduced me to the world of econometrics and was an invaluable discussion partner concerning various aspects of this dissertation.

Next, thanks to my employer, McKinsey & Company, for the generous financial and technical support (particular thanks to Heath Williams for the latter). In addition, I want to thank my two mentors, Dr. Basil Heeb for putting me in contact with Wegelin & Co., and Thomas Wirth for introducing me to Prof. Dr. Pascal Gantenbein.

Many thanks also to Factset, in particular to Ernest Breitschwerdt, for the support regarding various data-related aspects of this dissertation, which is indispensable in all empirical work.

My appreciation to the Gabler Verlag Wiesbaden for publishing my dissertation. Many thanks particularly to Sabine Schöller for her congenial collaboration during the printing preparation phase.

I also want to thank my close friends for accompanying me on this journey, particularly Dr. Paul Beck and Dr. Michael Luhn for the many enjoyable hours spent at the University, at the lunch table, or on the squash court.

Finally, my deepest gratitude goes to my parents, Margrith and Jost, and to my girlfriend Vera. It was invaluable to know that I always had their full support, even if the reasons for my ups and occasional downs during this work were not always comprehensible to them.

Zürich, November 2009
